SUMMARY

Product Manager with a Computer Science degree and five years in B2B SaaS, from the support queue to product analyst to PM. I ship AI products end to end: the intent taxonomy, the knowledge structure retrieval actually depends on, the working prototype, and the feedback loop that tells you whether any of it landed. I prototype the idea before I lock the spec, and I write specs a model can read.

EXPERIENCE

Product Manager — AIA Contract Documents

JAN 2024 – PRESENT

- Owned an internal AI support agent end to end on Microsoft Copilot Studio: designed the intent taxonomy by clustering real tickets on what the resolution required, ran the SME sessions that restructured authority documents into scoped retrievable sections, built and iterated the agent myself, and owned the post-launch loop.
- Defined explicit refusal paths as a design requirement: legal-interpretation questions route to a human by design rather than being answered. Every intent got one owner and one source of truth, so an unanswered question always had an address.
- Built the measurement loop before launch: in-conversation feedback plus unresolved-intent logging fed a weekly triage with three outcomes only — fix the source, extend the taxonomy, or route the topic to a human permanently. Failures became a maintained backlog instead of a mystery.
- Led an end-to-end rebuild of pay-application calculation logic, the workflow where money moves, cutting customer incidents 92% and improving input efficiency 32%. Tracked both, since incident volume alone can fall for the wrong reasons.
- Established the data model leadership believed was impossible: engineered SQL and Python pipelines in Azure Databricks linking DOD+ purchases to downstream subscriptions, then drove product, engineering, and leadership onto that one definition and retired the duplicate reporting.
- Own vision, strategy, roadmap, and backlog for a dedicated engineering team; usage analysis showing the top 20 forms drove 94% of activity set a phased rollout and defined what was cut.
- Prototype in Claude Code, Windsurf, and Figma during discovery week, while requirements are still cheap to change. Recognized with Rookie of the Year and Above & Beyond Awards two years running.

Product Analyst — AIA Contract Documents

JUL 2021 – JAN 2024

- Built and automated the leadership reporting layer in Python and SQL, defining the KPIs and the pipelines beneath them rather than consuming someone else's.
- Shipped internal tooling that removed operational cost, including entitlement automation that cut new-customer setup from 1.1 days to 30 minutes.
- Established the company's customer-signal program (NPS via UserPilot) and the loop converting signal into prioritized product decisions.

SELECTED WORK

Beacon angusfisher1.github.io/Educational_software_demo

Student learning dashboard where three surfaces feed each other: a knowledge radar showing mastery per concept, ranked next-best-action cards each with a stated reason, and a Socratic AI tutor whose session evidence updates the radar and reorders the cards. Built solo in Claude Code so the loop could be argued about in a browser instead of a deck.

NYT Spelling Bee Tracker

Live progress tool parsing the daily hint grid and updating remaining words, points, pangrams, and letter/length breakdowns in real time.

SKILLS

AI PRODUCTS — Intent taxonomy design, knowledge structuring for retrieval, prompt and context engineering, guardrails and explicit refusal paths, output-quality validation, unresolved-intent logging and triage loops; Microsoft Copilot Studio, Claude Code, Windsurf, GitHub Copilot, Power Automate.

DATA — SQL, Python, data pipelines, entity and grain modeling, KPI definition and instrumentation, Azure Databricks, PowerBI, Amplitude, Fullstory.

BUILDING — Python, TypeScript, React, HTML; Figma clickable flows and working demos ahead of engineering commitment.

PRODUCT — Vision, strategy and roadmap ownership for a dedicated engineering team, discovery and customer research, specs and acceptance criteria, prioritization without authority, Agile and Scrum, Azure DevOps.

EDUCATION

B.S., Computer Science — Keene State College

Prior: elite track and field throws coach; developed an athlete who competed at the Tokyo Olympics.
